

**fatal: unable to access 'https://github.com/archlinux07/01-September-AIST.git':
Failed to connect to github.com:443 after 21093 ms:
Could not connect to server**

means **Git is unable to establish an HTTPS connection to GitHub on port 443**. This is usually a network, proxy, firewall, DNS, or Git configuration issue—not a problem with git clone syntax.

1. Check your Internet connection

In **Command Prompt**, run:

```
ping github.com
```

Then:

```
curl -I https://github.com
```

If curl is not available, try:

```
nslookup github.com
```

You should get a GitHub IP address from nslookup.

2. Check whether GitHub HTTPS is reachable

Run:

```
curl -v https://github.com
```

If this cannot connect to port 443, your network/firewall/proxy may be blocking GitHub.

You can also test:

```
powershell -Command "Test-NetConnection github.com -Port 443"
```

Look for:

```
TcpTestSucceeded : True
```

If it says:

```
TcpTestSucceeded : False
```

then the problem is connectivity to GitHub, not Git itself.

3. Check Git proxy configuration

A very common cause on college/office networks is an incorrect Git proxy.

Run:

```
git config --global --get http.proxy
git config --global --get https.proxy
```

If these commands display an old or incorrect proxy, remove them:

```
git config --global --unset http.proxy
git config --global --unset https.proxy
```

Then check again:

```
git config --global --get http.proxy
git config --global --get https.proxy
```

Ideally, nothing should be displayed if you don't use a proxy.

Now try:

```
git clone https://github.com/archlinux07/01-September-AIST.git
```

4. Check Windows proxy settings

Open:

Settings → Network & Internet → Proxy

If you are not supposed to use a proxy, turn off:

- **Use a proxy server**
- **Use setup script**, if applicable

Then close and reopen Command Prompt.

5. Flush DNS

Open **Command Prompt as Administrator** and run:

```
ipconfig /flushdns
```

You should see:

Successfully flushed the DNS Resolver Cache.

Then:

```
ipconfig /release  
ipconfig /renew
```

Try:

```
git clone https://github.com/archlinux07/01-September-AIST.git
```

6. Try Google's DNS

If nslookup github.com is failing or DNS appears problematic, you can temporarily test another DNS server.

For example, set your network adapter's DNS to:

```
Preferred DNS: 8.8.8.8  
Alternate DNS: 1.1.1.1
```

Then run:

```
ipconfig /flushdns
```

and:

```
nslookup github.com
```

7. Check whether your college/office network blocks GitHub

Because you're using a network that may have institutional firewall/proxy restrictions, this is worth checking.

Try opening this in your browser:

[GitHub](https://github.com)

If GitHub doesn't open in the browser either, Git is probably not the problem.

You can also test using a **mobile hotspot**:

1. Connect Windows to your phone's hotspot.
2. Open Command Prompt.
3. Run:

```
git clone https://github.com/archlinux07/01-September-AIST.git
```

If it works through the hotspot

Your original Wi-Fi/LAN network is likely blocking or interfering with GitHub HTTPS.

8. Check Windows Firewall/security software

If GitHub works in your browser but Git does not, security software may be interfering with Git.

First check whether Git is installed correctly:

```
git --version
```

Example:

```
git version 2.51.0.windows.1
```

Also check where Git is installed:

```
where git
```

Typical result:

```
C:\Program Files\Git\cmd\git.exe
```

9. Test GitHub through Git itself

Run:

```
git ls-remote https://github.com/archlinux07/01-September-AIST.git
```

If connectivity is working, you should get Git references such as:

```
xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx HEAD
xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx refs/heads/main
```

If you get the same:

```
Failed to connect to github.com:443
```

then the issue is still network/proxy/firewall connectivity.

10. Make sure you are using the correct repository URL

Your command syntax is correct:

```
git clone https://github.com/archlinux07/01-September-AIST.git
```

You can verify the repository in your browser:

Repository on GitHub

If the repository is **private**, after connectivity is fixed Git may ask you to authenticate.

Recommended troubleshooting sequence

I recommend running these commands **in this exact order**:

```
git --version
nslookup github.com
curl -I https://github.com
powershell -Command "Test-NetConnection github.com -Port 443"
```

Then check proxy:

```
git config --global --get http.proxy
git config --global --get https.proxy
```

If you don't use a proxy:

```
git config --global --unset http.proxy
git config --global --unset https.proxy
```

Then:

```
ipconfig /flushdns
```

Finally:

```
git ls-remote https://github.com/archlinux07/01-September-AIST.git
```

and:

```
git clone https://github.com/archlinux07/01-September-AIST.git
```

Most important point

Your error is specifically:

Failed to connect to github.com:443

So **don't reinstall Git first**. First determine whether Windows can reach github.com on **TCP port 443**. The command below gives the clearest answer:

powershell -Command "Test-NetConnection github.com -Port 443"

If you paste the output of these **three commands** here:

nslookup github.com
powershell -Command "Test-NetConnection github.com -Port 443"
git config --global --get https.proxy

I can tell you exactly where the problem is and what command to run next.
